Multimodal RAG Practice PDF

A small sample document containing vector diagrams, flowcharts, and labeled components for experimenting with PDF rendering, visual extraction, and vision-model understanding.

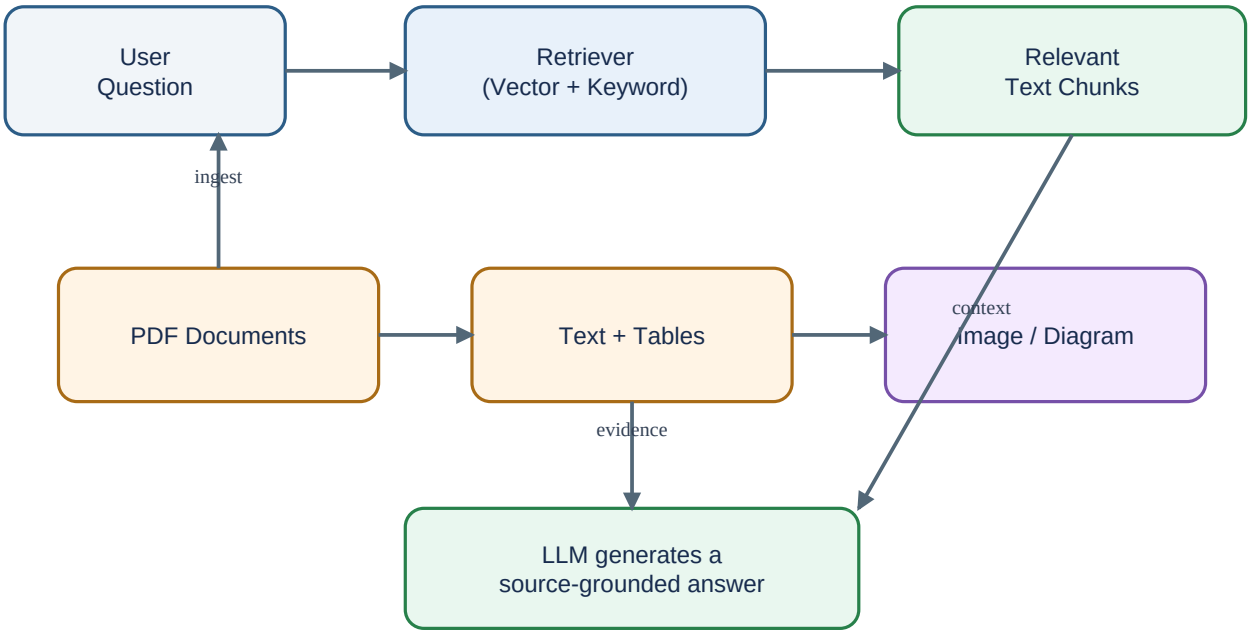
What is inside?

Page	Visual content	What to test
2	RAG architecture diagram	Identify components and data flow
3	Incident response flowchart	Read decision branches and severity labels
4	Service network diagram	Identify services, arrows, and relationships

Note: The diagrams are drawn as PDF vector shapes, not embedded bitmap images. That is useful for testing whether a pipeline can render a PDF page to an image and then send the rendered page to a vision model.

1. RAG System Architecture

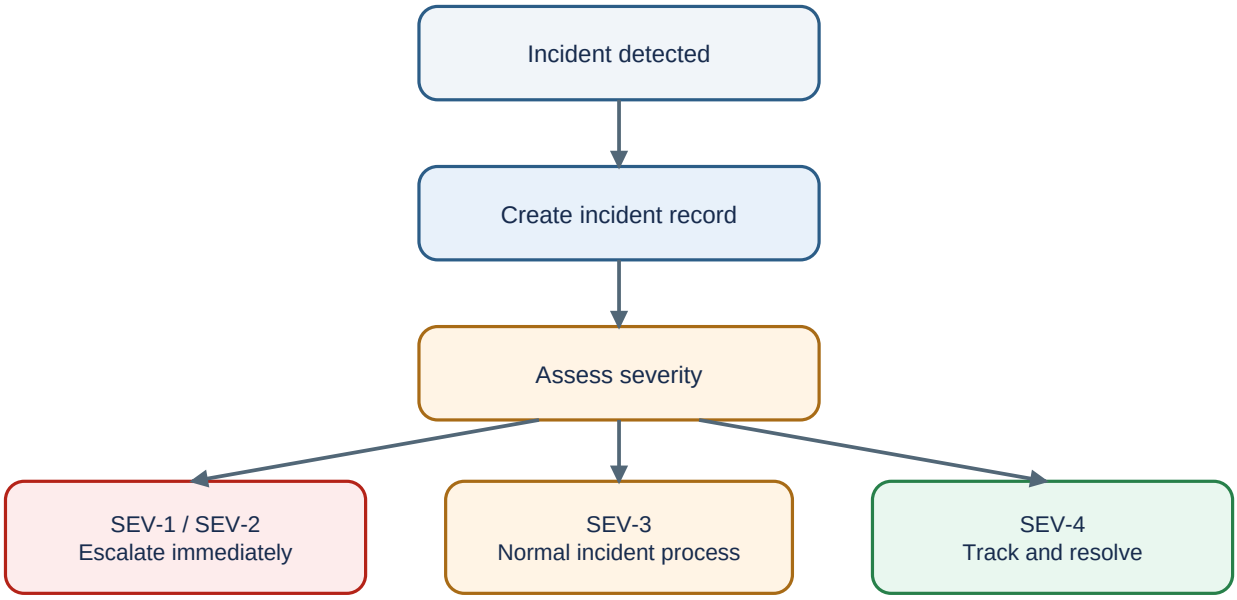
This diagram shows a simplified retrieval-augmented generation pipeline. Documents are ingested, evidence is retrieved for a question, and an answer is generated using the retrieved context.



Practice questions: What component retrieves relevant chunks? Which sources are represented during ingestion? What is passed to the answer generator?

2. Incident Response Flowchart

Follow the arrows from incident detection through severity assessment. This diagram is intended to test reading labels and understanding branching flows from a visual.

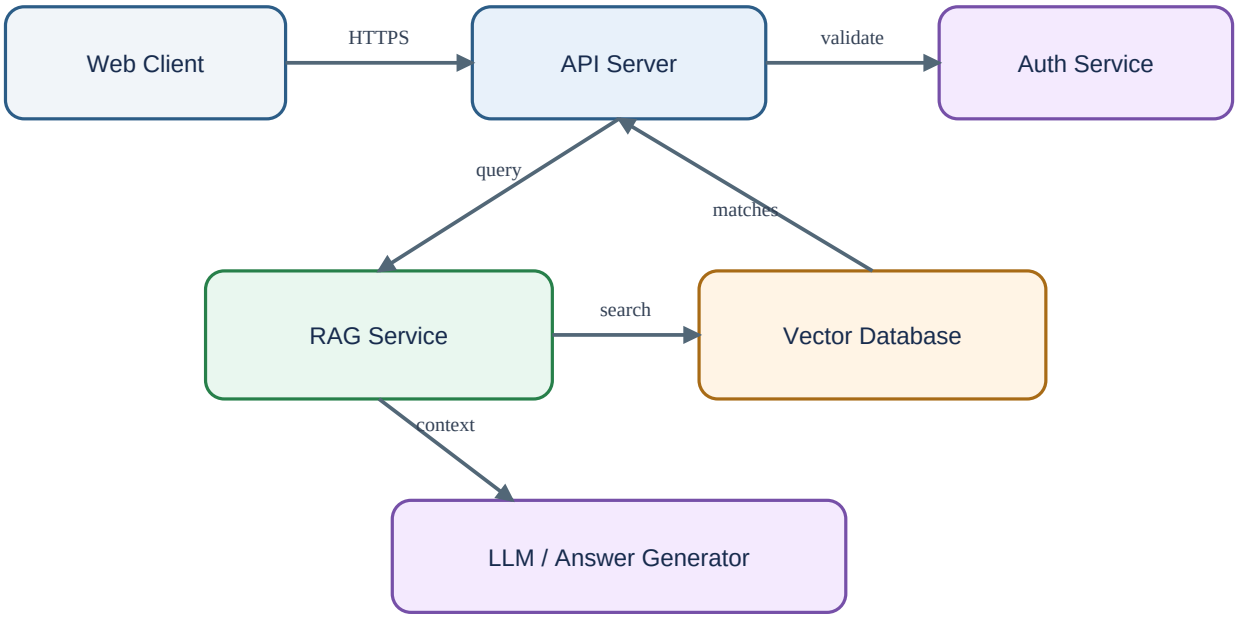


Example training diagram — not an official incident policy

Practice questions: What happens after an incident is detected? Which branch says to escalate immediately? What is the suggested handling for SEV-4 in this example?

3. Service Network Diagram

This diagram shows a client, API server, authentication service, RAG service, vector database, and answer generator. Arrows show example request and retrieval relationships.



Practice questions: Which service receives the client request? Which component stores/searches embeddings? What is the RAG service asking the vector database to return?

Educational sample only. The diagrams are simplified examples, not deployment instructions or official policies.
